CIRCUIT DESCRIPTION

• 430MHz band

Incoming 430MHz-band signals from the antenna are passed through a low-pass filter in the final block of the transmitter system and switched to the front-end of the receiver system via a transmit/receive switching diode. This signal is then passed through an antenna matching coil in the front-end and amplified by a GaAs FET and a junction-type FET. The signal is then fed into a two-pole helical resonator and fed into the 1st mixer. The 1st mixer combines the signal with the 1st local oscillator signal from the PLL and converts it to the 1st IF of 30.825MHz (E. E2. M. M2) and 21.6MHz (K. P).

The 1st IF signal is amplified and fed into IC3 (KCD04) in the FM IF HIC (HIC=Hybrid IC). The IF signal is mixed with the 2nd local oscillator signal of 30.37MHz (E. E2. M. M2) and 21.145MHz (K.P) to produce the 2nd IF of 455kHz. The 455kHz signal is then passed through an FM ceramic filter and fed into IC3 again for amplification. The output signal from IC3 is then fed into a power amplifier via the audio volume control and sent to the speaker.

Fig. 3 (1) Main and sub switching, sub-mute switching circuit

• S-meter circuit

The S-meter control voltage from IC3 and IC11 (KCD04) in the FM IF HIC is fed into the control unit. The CPU digitizes the analog voltage to operate the LCD bar meter.

• AF section main and sub switching, sub-mute switching

The audio signal detected by the FM IF HIC is passed through AF mute Q5 and Q6 for VHF and UHF, and is output through the preamplifier.

When two signals are received at the same time, the attenuator is connected to the sub side by analog switch (1) BU4053BF, and the signals are mixed with the main output through the preamplifier, and are output. The attenuator on the sub side controls Q1 to Q4 with shift register (1) BU4094BF and is muted in 16 steps (0 to about 20dB).

• VR switching

Normally, analog switch (2) BU4053BF operates so that the audio signal output from the preamplifier can be adjusted by the VR on the panel. When a remote controller is used, shift register (2) BU4094BF operates according to the data from the CPU, analog switch (2) BU4053BF is changed over, and the electronic VR LC7532M is controlled to adjust the level.

• Shift register (1) (2)

The following control is executed by sending serial data from the CPU to the shift register (1) (2) (BU4094BF) in the electronic volume control module (X59-3800-00).

CIRCUIT DESCRIPTION

Transmitting System

• General

Separate circuits are provided for the 2 meter and 70 meter band, except for the mic amplifier and APC circuits.

• Modulation circuit

Audio signals from the microphone are fed into the mic amplifier for amplification, and then into two operational amplifiers. The operational amplifiers form a splatter filter and provide pre-emphasis, amplification, limiting, and removal of undesirable high-frequency components.

The modulation circuit directly frequency-modulates the VCO (Voltage Controlled Oscillator) signals for both the 144MHz and 430MHz bands using a varactor diode.

• Preamplifier circuit

The output signal from the VCO is applied to drive HIC IC9 (KCB05; two-stage linear amplifier) for the 144MHz band, and drive HIC IC10 (KCB04; three-stage linear amplifier) for the 430MHz band.

This amplifier is designed to cover a wide range of frequencies, and can produce stable output without adjustment. The APC control the collector voltage from the last stage of the amplifier.

• Power amplifier circuit

The drive signal is amplified to the required level by the power module. The signal is passed through a transmit/receive diode switch and filter, and output to the antenna.

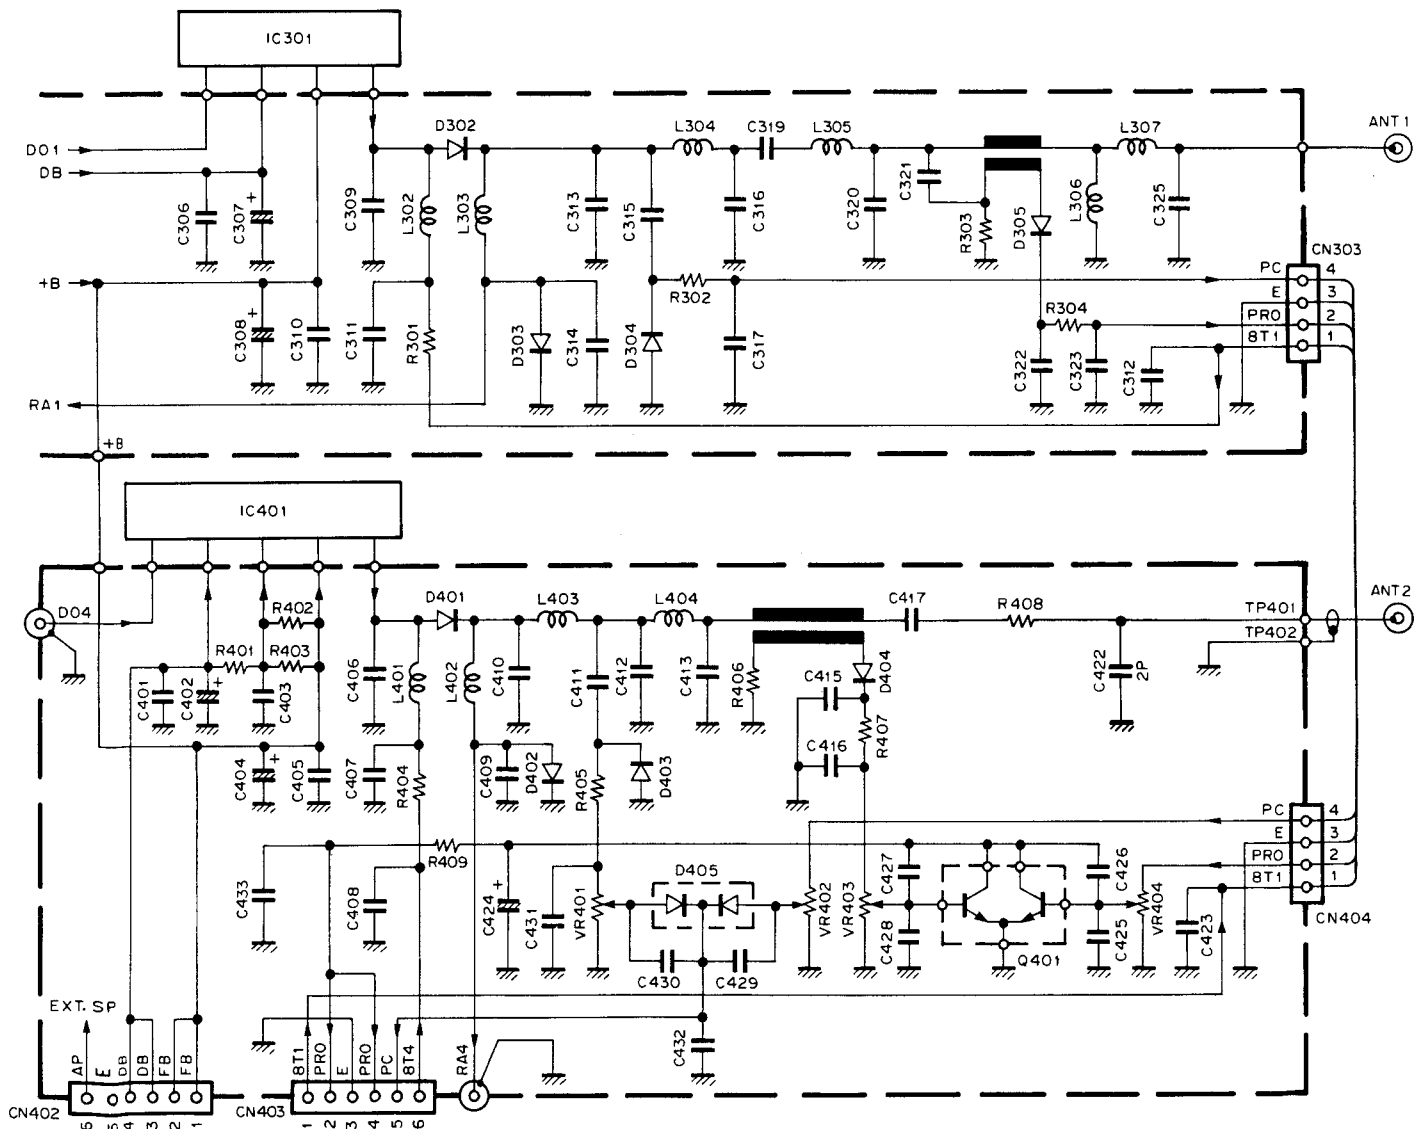

Fig. 4 Transmitting circuit

CIRCUIT DESCRIPTION

• APC (Automatic Power Control) and SWR (Standing Wave Ratio) protection circuits

The SWR protection circuit detects any reflected power produced by a mismatch in the antenna with a CM (CM=Capacitance matching) coupler and amplifies it. This circuit reduces the output control voltage and the gain to protect the power module.

The APC circuit detects a portion of the power module output and amplifies it to obtain a control voltage for output control. Since the output control voltage is inversely proportional to the output of the power module, the output is kept constant.

The power switching circuit uses the output of the shift register (BU4094BF) in the electronic volume control module (X59-3800-00). When the LOW switch on the panel is pressed and LOW is indicated, an "H" signal is output from pin 4 of the shift register (BU4094BF); this turns Q33 of the TX-RX unit on, selecting LOW power.

When the MID switch on the panel is pressed and MID is indicated, an "H" signal is output from Pin 5 of the shift register (BU4094BF); this turns Q32 of the TX-RX unit on, selecting MID power.

TM-702A/E

CIRCUIT DESCRIPTION

PLL Synthesizer Block

The TM-702A/E PLL system is implemented as a sub-unit divided into upper VCO and lower PLL blocks. The 144MHz-band PLL block is independent of the 430MHz-band PLL block. The sub-unit is shielded to prevent external interference.

Two reference frequencies, 6.25kHz and 5kHz, are provided in order to allow 5, 10, 12.5, 15, 20, and 25kHz step operation by dividing the reference oscillator frequency of 12.8MHz by 2048 and 2560.

The VCO directly generates the target frequency. This signal is amplified once and then fed into a

pulse-swallow PLL IC for frequency division and phase comparison.

The 144MHz-band PLL system has two VCOs, one for transmission and one for reception. Using a signal ("H" in transmit mode) from pin 10 of the PLL IC (M54959FP), the LPF is deactivated by Q105 only for the instant when the TM-702A/E enters transmit mode. This helps produce a more rapid PLL lock-up.

The 430MHz-band PLL system has a single VCO for transmission and reception. Using Q5 as a switch, it reduces the PLL lock-up time in the same way as for the 144MHz section.

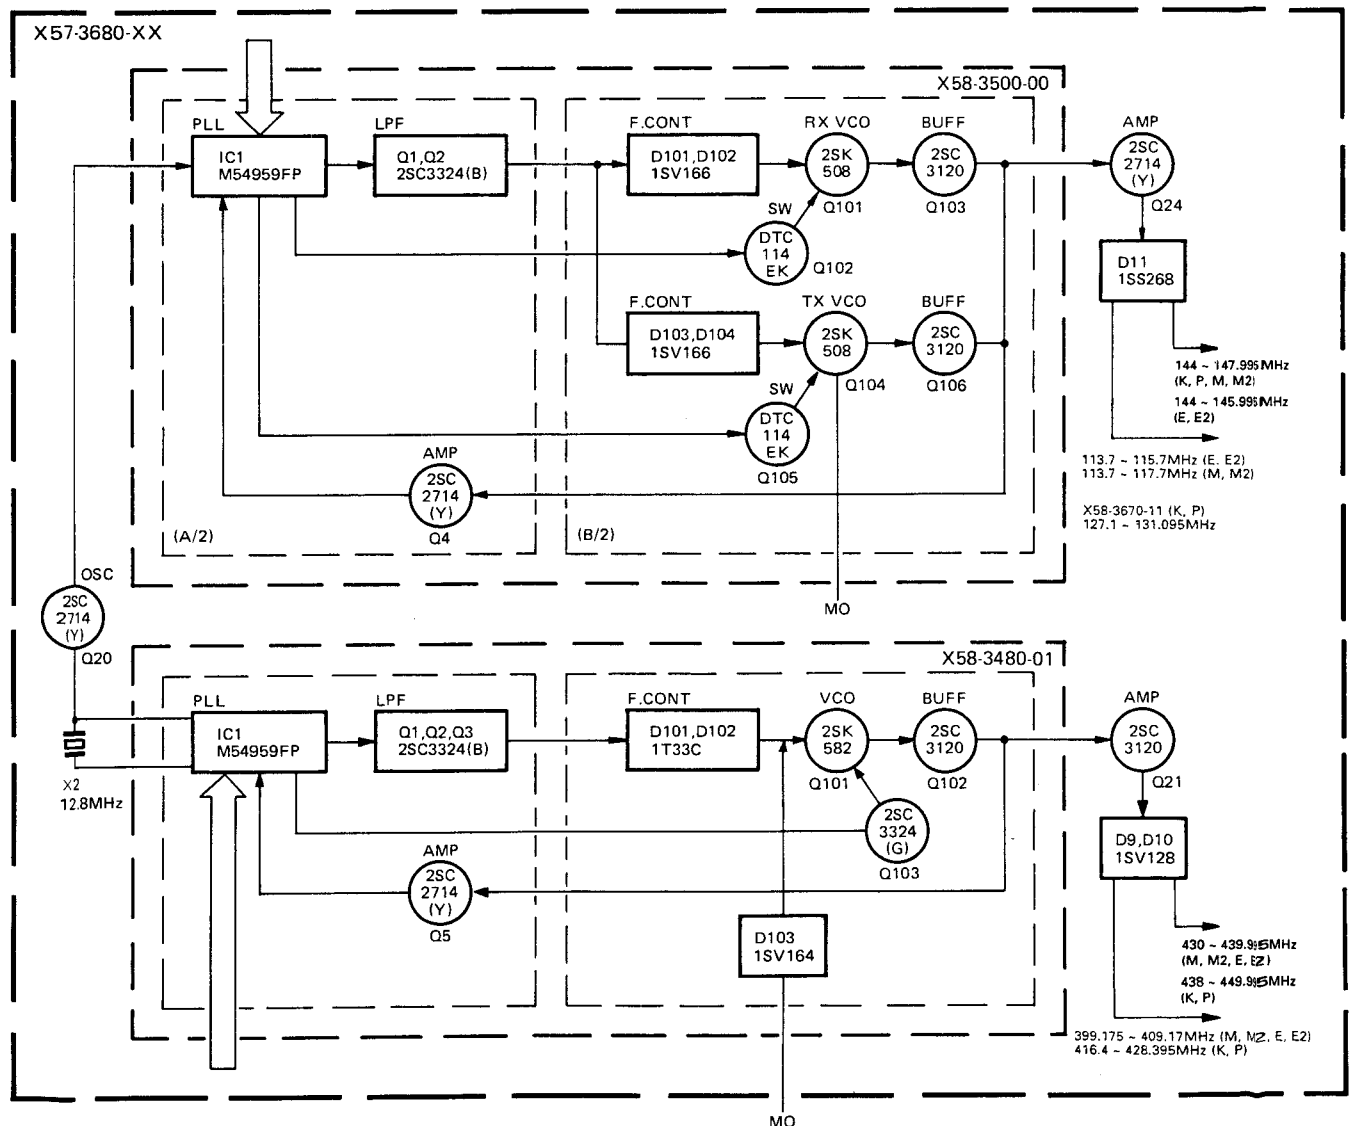

Fig. 6 PLL block diagram

CIRCUIT DESCRIPTION

• 8T (transmit 8V) switching and unlock circuits

1) 8T switching circuit

During 430MHz/144MHz transmission, T4 and T1 of IC5 in the HIC go to the "L" level (0V). As a result, Q26 and Q29 turn off, digital transistors Q27, Q30, Q28, and Q31 turn on, and 8T4 and 8T1 are supplied with 8V from the 8C line.

During receive, T4/T1 is at the "H" level (5V), and Q26 and Q29 turn on and Q27, Q30, and Q31 turn off. 8V is not supplied to 8T4 and 8T1.

2) Unlock circuit

Unlock data pin LD of the PLL sub-unit is normally at the "L" level (0V). When the 8T switching circuit operates, the transmit circuit is supplied with 8V.

When the PLL is unlocked, pin LD goes to the "H" level (5V), and Q26 and Q29 turn on. This turns Q27, Q30, Q28, and Q31 off, removing 8V from 8T4 and 8T1. Thus, no transmit signal is generated.

Digital Control Unit

• Overview

The digital control unit consists of a keyboard, a rotary encoder input, a display, a reset circuit, a back-up circuit, and a tone generator.

• Key and rotary encoder input circuits

The keys on the panel are arranged in a matrix. Key input is fed into the CPU, using a key scan technique. Output from the rotary encoder is fed directly into the CPU.

• Microphone key input circuit

The UP and DOWN keys and the other function keys for the microphone are connected directly to their corresponding analog input pins on the CPU. The function for each key is activated by a voltage produced when the corresponding key is pressed.

LEVEL DIAGRAM

Receiver section

1. SG input level for which 12dB SINAD is obtained. Measured by connecting the SG to each point via a 0.01μF capacitor.
2. AF level obtained when the AF output level is adjusted for 0.63V/8W with the front panel AF VOL control. Measured with AF voltmeter connected to the external speaker jack, receiving a 40dB EMF SSG signal modulated at 1kHz, DEV 3kHz.

Transmitter section

1. AG is set so that MIC input becomes 3kHz DEV at 1kHz MOD.
2. Transmitting frequency : 145.06 MHz

TSU-6 FINE ADJUSTMENT OF TONE FREQUENCY

The tone frequency can be fine adjusted with an interval of 0.5% step over the range of 0 to + 1.5%. Ground the T1 (pin 10) and T2 (pin 9) of IC1 to obtain the desired frequency.

	T1	T2
0%	×	×
+0.5%	○	×
+1.0%	×	○
+1.5%	○	○
